

My pc-muse never arrived

My pc-muse never visited me for the first U3A meeting after the summer break; but I managed to talk about emails and virus “pass-on” when replying, thanks to one member sending in a question about it.

This led to talking about Office Outlook 2010 and Microsoft forcing users to change to MS-Exchange Server. By telling them about my experiences, I touched on a couple of features in Outlook 2010 that the members were not aware of: Filters, Task, Appointments and recurrence. This will now become a topic for the next U3A meeting.

I also talked about backup; because I was annoyed that some backup programs don't warn the user NOT to backup onto the same device where the data is held. This led to questions about how to backup Outlook 2010 and a physical demo of said as a topic for the next meeting.

When I was talking about my email system I demonstrated the way I had managed to move my system from Outlook 2010 to Mozilla Thunderbird; and vaguely touched on the difficulties of syncing the calendar from my PC to my mobile phone and tablet. Some members were interested in Thunderbird; like how to get started, download, install, and setup the email accounts. So here is another topic for a later U3A meeting.

I can't remember how it came about; but somehow we managed to talk about OCR and I stated that most three-in-one printers came with some sort of OCR software; most members were not aware of this; so I requested they send me the name of their printer and I would check their software packages. This will become a short topic for another U3A meeting.

While talking OCR I also mentioned that the software I am using (OmniPage Pro) will let me open a picture of text, scan it and create text that can be imported into Word or Excel.

This is quite a snazzy feature but I think one has to pay for that feature.

Somewhere along the many thoughts that were flying about we also spoke about using "Google Translate" to capture speech and convert it into text for Word. I tried it on the laptop but the microphone wasn't available. Why? Because some laptops don't have microphones installed. But if you add an external microphone to the laptop; Google Translate will display the mic-symbol.

I promised that I would find some Win10 problems pages:

First something positive about Win10:
